MATERIALS AND METHODS FOR THE MODIFICATION OF PLANT LIGNIN CONTENT

5 Technical Field of the Invention

This invention relates to the field of modification of lignin content and composition in plants. More particularly, this invention relates to enzymes involved in the lignin biosynthetic pathway and nucleotide sequences encoding such enzymes.

10 Background of the Invention

Lignin is an insoluble polymer which is primarily responsible for the rigidity of plant stems. Specifically, lignin serves as a matrix around the polysaccharide components of some plant cell walls. The higher the lignin content, the more rigid the plant. For example, tree species synthesize large quantities of lignin, with lignin
15 constituting between 20% to 30% of the dry weight of wood. In addition to providing rigidity, lignin aids in water transport within plants by rendering cell walls hydrophobic and water impermeable. Lignin also plays a role in disease resistance of plants by impeding the penetration and propagation of pathogenic agents.

The high concentration of lignin in trees presents a significant problem in the
20 paper industry wherein considerable resources must be employed to separate lignin from the cellulose fiber needed for the production of paper. Methods typically employed for the removal of lignin are highly energy- and chemical-intensive, resulting in increased costs and increased levels of undesirable waste products. In the U.S. alone, about 20 million tons of lignin are removed from wood per year.

25 Lignin is largely responsible for the digestibility, or lack thereof, of forage crops, with small increases in plant lignin content resulting in relatively high decreases in digestibility. For example, crops with reduced lignin content provide more efficient forage for cattle, with the yield of milk and meat being higher relative to the amount of forage crop consumed. During normal plant growth, the increase in dry matter content
30 is accompanied by a corresponding decrease in digestibility. When deciding on the optimum time to harvest forage crops, farmers must therefore chose between a high yield of less digestible material and a lower yield of more digestible material.

For some applications, an increase in lignin content is desirable since increasing the lignin content of a plant would lead to increased mechanical strength of wood, changes in its color and increased resistance to rot. Mycorrhizal species composition and abundance may also be favorably manipulated by modifying lignin content and structural composition.

As discussed in detail below, lignin is formed by polymerization of at least three different monolignols which are synthesized in a multistep pathway, each step in the pathway being catalyzed by a different enzyme. It has been shown that manipulation of the number of copies of genes encoding certain enzymes, such as cinnamyl alcohol dehydrogenase (CAD) and caffeic acid 3-O-methyltransferase (COMT) results in modification of the amount of lignin produced; see, for example, U.S. Patent No. 5,451,514 and PCT publication no. WO 94/23044. Furthermore, it has been shown that antisense expression of sequences encoding CAD in poplar leads to the production of lignin having a modified composition (Grand, C. et al. Planta (Berl.) 163:232-237 (1985)).

While DNA sequences encoding some of the enzymes involved in the lignin biosynthetic pathway have been isolated for certain species of plants, genes encoding many of the enzymes in a wide range of plant species have not yet been identified. Thus there remains a need in the art for materials useful in the modification of lignin content and composition in plants and for methods for their use.

Summary of the Invention

Briefly, the present invention provides isolated DNA sequences obtainable from eucalyptus and pine which encode enzymes involved in the lignin biosynthetic pathway, DNA constructs including such sequences, and methods for the use of such constructs. Transgenic plants having altered lignin content and composition are also provided.

In a first aspect, the present invention provides isolated DNA sequences coding for the following enzymes isolated from eucalyptus and pine: cinnamate 4-hydroxylase (C4H), coumarate 3-hydroxylase (C3H), phenolase (PNL), O-methyl transferase (OMT), cinnamyl alcohol dehydrogenase (CAD), cinnamoyl-CoA reductase (CCR), phenylalanine ammonia-lyase (PAL), 4-coumarate:CoA ligase (4CL), coniferol

glucosyl transferase (CGT), coniferin *beta*-glucosidase (CBG), laccase (LAC) and peroxidase (POX), together with ferulate-5-hydroxylase (F5H) from eucalyptus. In one embodiment, the isolated DNA sequences comprise a nucleotide sequence selected from the group consisting of: (a) sequences recited in SEQ ID NO: 3, 13, 16-70, and
5 72-88; (b) complements of the sequences recited in SEQ ID NO: 3, 13, 16-70, 72-88; (c) reverse complements of the sequences recited in SEQ ID NO: 3, 13, 16-70, 72-88; (d) reverse sequences of the sequences recited in SEQ ID NO: 3, 13, 16-70, 72-88; and (e) sequences having at least about a 99% probability of being the same as a sequence of (a) – (d) as measured by the computer algorithm FASTA.

10 In another aspect, the invention provides DNA constructs comprising a DNA sequence of the present invention, either alone, in combination with one or more of the inventive sequences or in combination with one or more known DNA sequences; together with transgenic cells comprising such constructs.

In a related aspect, the present invention provides DNA constructs comprising,
15 in the 5'-3' direction, a gene promoter sequence; an open reading frame coding for at least a functional portion of an enzyme encoded by the inventive DNA sequences or variants thereof; and a gene termination sequence. The open reading frame may be orientated in either a sense or antisense direction. DNA constructs comprising a non-coding region of a gene coding for an enzyme encoded by the above DNA sequences or
20 a nucleotide sequence complementary to a non-coding region, together with a gene promoter sequence and a gene termination sequence, are also provided. Preferably, the gene promoter and termination sequences are functional in a host plant. Most preferably, the gene promoter and termination sequences are those of the original enzyme genes but others generally used in the art, such as the Cauliflower Mosaic
25 Virus (CMV) promoter, with or without enhancers, such as the Kozak sequence or Omega enhancer, and *Agrobacterium tumefaciens* nopal synthase terminator may be usefully employed in the present invention. Tissue-specific promoters may be employed in order to target expression to one or more desired tissues. In a preferred embodiment, the gene promoter sequence provides for transcription in xylem. The
30 DNA construct may further include a marker for the identification of transformed cells.

In a further aspect, transgenic plant cells comprising the DNA constructs of the present invention are provided, together with plants comprising such transgenic cells, and fruits and seeds of such plants.

In yet another aspect, methods for modulating the lignin content and composition of a plant are provided, such methods including stably incorporating into the genome of the plant a DNA construct of the present invention. In a preferred embodiment, the target plant is a woody plant, preferably selected from the group consisting of eucalyptus and pine species, most preferably from the group consisting of *Eucalyptus grandis* and *Pinus radiata*. In a related aspect, a method for producing a plant having altered lignin content is provided, the method comprising transforming a plant cell with a DNA construct of the present invention to provide a transgenic cell, and cultivating the transgenic cell under conditions conducive to regeneration and mature plant growth.

In yet a further aspect, the present invention provides methods for modifying the activity of an enzyme in a plant, comprising stably incorporating into the genome of the plant a DNA construct of the present invention. In a preferred embodiment, the target plant is a woody plant, preferably selected from the group consisting of eucalyptus and pine species, most preferably from the group consisting of *Eucalyptus grandis* and *Pinus radiata*.

The above-mentioned and additional features of the present invention and the manner of obtaining them will become apparent, and the invention will be best understood by reference to the following more detailed description, read in conjunction with the accompanying drawing.

Brief Description of the Figures

Fig. 1 is a schematic overview of the lignin biosynthetic pathway.

Detailed Description

Lignin is formed by polymerization of at least three different monolignols, primarily *para*-coumaryl alcohol, coniferyl alcohol and sinapyl alcohol. While these three types of lignin subunits are well known, it is possible that slightly different variants of these subunits may be involved in the lignin biosynthetic pathway in various

plants. The relative concentration of these residues in lignin varies between different plant species and within species. In addition, the composition of lignin may also vary between different tissues within a specific plant. The three monolignols are derived from phenylalanine in a multistep process and are believed to be polymerized into
5 lignin by a free radical mechanism.

Fig. 1 shows the different steps in the biosynthetic pathway for coniferyl alcohol together with the enzymes responsible for catalyzing each step. *para*-Coumaryl alcohol and sinapyl alcohol are synthesized by similar pathways. Phenylalanine is first deaminated by phenylalanine ammonia-lyase (PAL) to give cinnamate which is then
10 hydroxylated by cinnamate 4-hydroxylase (C4H) to form *p*-coumarate. *p*-Coumarate is hydroxylated by coumarate 3-hydroxylase to give caffeate. The newly added hydroxyl group is then methylated by O-methyl transferase (OMT) to give ferulate which is conjugated to coenzyme A by 4-coumarate:CoA ligase (4CL) to form feruloyl-CoA. Reduction of feruloyl-CoA to coniferaldehyde is catalyzed by cinnamoyl-CoA
15 reductase (CCR). Coniferaldehyde is further reduced by the action of cinnamyl alcohol dehydrogenase (CAD) to give coniferyl alcohol which is then converted into its glucosylated form for export from the cytoplasm to the cell wall by coniferol glucosyl transferase (CGT). Following export, the de-glucosylated form of coniferyl alcohol is obtained by the action of coniferin *beta*-glucosidase (CBG). Finally, polymerization of
20 the three monolignols to provide lignin is catalyzed by phenolase (PNL), laccase (LAC) and peroxidase (POX).

The formation of sinapyl alcohol involves an additional enzyme, ferulate-5-hydroxylase (F5H). For a more detailed review of the lignin biosynthetic pathway, see: Whetton, R. and Sederoff, R., The Plant Cell, 7:1001-1013 (1995).

25 Quantitative and qualitative modifications in plant lignin content are known to be induced by external factors such as light stimulation, low calcium levels and mechanical stress. Synthesis of new types of lignins, sometimes in tissues not normally lignified, can also be induced by infection with pathogens. In addition to lignin, several other classes of plant products are derived from phenylalanine, including flavonoids, coumarins, stilbenes and benzoic acid derivatives, with the initial steps in the synthesis
30 of all these compounds being the same. Thus modification of the action of PAL, C4H and 4CL may affect the synthesis of other plant products in addition to lignin.

Using the methods and materials of the present invention, the lignin content of a plant can be increased by incorporating additional copies of genes encoding enzymes involved in the lignin biosynthetic pathway into the genome of the target plant. Similarly, a decrease in lignin content can be obtained by transforming the target plant with antisense copies of such genes. In addition, the number of copies of genes encoding for different enzymes in the lignin biosynthetic pathway can be manipulated to modify the relative amount of each monolignol synthesized, thereby leading to the formation of lignin having altered composition. The alteration of lignin composition would be advantageous, for example, in tree processing for paper, and may also be effective in altering the palatability of wood materials to rotting fungi.

In one embodiment, the present invention provides isolated complete or partial DNA sequences encoding, or partially encoding, enzymes involved in the lignin biosynthetic pathway, the DNA sequences being obtainable from eucalyptus and pine. Specifically, the present invention provides isolated DNA sequences encoding the enzymes CAD (SEQ ID NO: 1, 30), PAL (SEQ ID NO: 16), C4H (SEQ ID NO: 17), C3H (SEQ ID NO: 18), F5H (SEQ ID NO: 19-21), OMT (SEQ ID NO: 22-25), CCR (SEQ ID NO: 26-29), CGT (SEQ ID NO: 31-33), CBG (SEQ ID NO: 34), PNL (SEQ ID NO: 35, 36), LAC (SEQ ID NO: 37-41) and POX (SEQ ID NO: 42-44) from *Eucalyptus grandis*; and the enzymes C4H (SEQ ID NO: 2, 3, 48, 49), C3H (SEQ ID NO: 4, 50-52), PNL (SEQ ID NO: 5, 81), OMT (SEQ ID NO: 6, 53-55), CAD (SEQ ID NO: 7, 71), CCR (SEQ ID NO: 8, 58-70), PAL (SEQ ID NO: 9-11, 45-47), 4CL (SEQ ID NO: 12, 56, 57), CGT (SEQ ID NO: 72), CBG (SEQ ID NO: 73-80), LAC (SEQ ID NO: 82-84) and POX (SEQ ID NO: 13, 85-88) from *Pinus radiata*. Complements of such isolated DNA sequences, reverse complements of such isolated DNA sequences and reverse sequences of such isolated DNA sequences, together with variants of such sequences, are also provided. DNA sequences encompassed by the present invention include cDNA, genomic DNA, recombinant DNA and wholly or partially chemically synthesized DNA molecules.

The definition of the terms "complement", "reverse complement" and "reverse sequence", as used herein, is best illustrated by the following example. For the sequence 5' AGGACC 3', the complement, reverse complement and reverse sequence are as follows:

complement	3' TCCTGG 5'
reverse complement	3' GGTCCT 5'
reverse sequence	5' CCAGGA 3'.

As used herein, the term "variant" covers any sequence which exhibits at least about 50%, more preferably at least about 70% and, more preferably yet, at least about 90% identity to a sequence of the present invention. Most preferably, a "variant" is any sequence which has at least about a 99% probability of being the same as the inventive sequence. The probability for DNA sequences is measured by the computer algorithm FASTA (version 2.0u4, February 1996; Pearson W. R. et al., Proc. Natl. Acad. Sci., 85:2444-2448, 1988), the probability for translated DNA sequences is measured by the computer algorithm TBLASTX and that for protein sequences is measured by the computer algorithm BLASTP (Altschul, S. F. et al. J. Mol. Biol., 215:403-410, 1990). The term "variants" thus encompasses sequences wherein the probability of finding a match by chance (smallest sum probability) in a database, is less than about 1% as measured by any of the above tests.

Variants of the isolated sequences from other eucalyptus and pine species, as well as from other commercially important species utilized by the lumber industry, are contemplated. These include the following gymnosperms, by way of example: loblolly pine *Pinus taeda*, slash pine *Pinus elliotti*, sand pine *Pinus clausa*, longleaf pine *Pinus palustris*, shortleaf pine *Pinus echinata*, ponderosa pine *Pinus ponderosa*, Jeffrey pine *Pinus jeffrey*, red pine *Pinus resinosa*, pitch pine *Pinus rigida*, jack pine *Pinus banksiana*, pond pine *Pinus serotina*, Eastern white pine *Pinus strobus*, Western white pine *Pinus monticola*, sugar pine *Pinus lambertiana*, Virginia pine *Pinus virginiana*, lodgepole pine *Pinus contorta*, Caribbean pine *Pinus caribaea*, *P. pinaster*, Calabrian pine *P. brutia*, Afghan pine *P. eldarica*, Coulter pine *P. coulteri*, European pine *P. nigra* and *P. sylvestris*; Douglas-fir *Pseudotsuga menziesii*; the hemlocks which include Western hemlock *Tsuga heterophylla*, Eastern hemlock *Tsuga canadensis*, Mountain hemlock *Tsuga mertensiana*; the spruces which include the Norway spruce *Picea abies*, red spruce *Picea rubens*, white spruce *Picea glauca*, black spruce *Picea mariana*, Sitka spruce *Picea sitchensis*, Englemann spruce *Picea engelmanni*, and blue spruce *Picea pungens*; redwood *Sequoia sempervirens*; the true firs include the Alpine fir *Abies lasiocarpa*, silver fir *Abies amabilis*, grand fir *Abies grandis*, noble fir *Abies procera*, white fir *Abies concolor*, California red fir *Abies magnifica*, and balsam fir *Abies balsamea*, the cedars which include the Western red cedar *Thuja plicata*, incense

cedar *libocedrus decurrens*, Northern white cedar *Thuja occidentalis*, Port Orford cedar *Chamaecyparis lawsoniana*, Atlantic white cedar *Chamaecyparis thyoides*, Alaska yellow-cedar *Chamaecyparis nootkatensis*, and Eastern red cedar *Huniperus virginiana*; the larches which include Eastern larch *Larix laricina*. Western larch *Larix*
 5 *occidentalis*, European larch *Larix decidua*, Japanese larch *Larix leptolepis*, and Siberian larch *Larix siberica*; bold cypress *Taxodium distichum* and Giant sequoia *Sequoia gigantea*;

and the following angiosperms, by way of example:

Eucalyptus alba, *E. bancroftii*, *E. botryoides*, *E. bridgesiana*, *E. calophylla*, *E.*
 10 *camaldulensis*, *E. citriodora*, *E. cladocalyx*, *E. coccifera*, *E. curtisii*, *E. dalrympleana*, *E. deglupta*, *E. delagatensis*, *E. diversicolor*, *E. dunnii*, *E. ficifolia*, *E. globulus*, *E. gomphocephala*, *E. gunnii*, *E. henryi*, *E. laevopinea*, *E. macarthurii*, *E. macrorhyncha*,
E. maculata, *E. marginata*, *E. megacarpa*, *E. melliodora*, *E. nicholii*, *E. nitens*, *E. nova-*
 15 *anglica*, *E. obliqua*, *E. obtusiflora*, *E. oreades*, *E. pauciflora*, *E. polybractea*, *E. regnans*,
E. resinifera, *E. robusta*, *E. rudis*, *E. saligna*, *E. sideroxylon*, *E. stuartiana*, *E. tereticornis*,
E. torelliana, *E. urnigera*, *E. urophylla*, *E. viminalis*, *E. viridis*, *E. wandoo* and *E. youmanni*.

The inventive DNA sequences may be isolated by high throughput sequencing of cDNA libraries such as those prepared from *Eucalyptus grandis* and *Pinus radiata*
 20 as described below in Examples 1 and 2. Alternatively, oligonucleotide probes based on the sequences provided in SEQ ID NO: 1-13 and 16-88 can be synthesized and used to identify positive clones in either cDNA or genomic DNA libraries from *Eucalyptus grandis* and *Pinus radiata*, or from other gymnosperms and angiosperms including those identified above, by means of hybridization or PCR techniques.
 25 Probes can be shorter than the sequences provided herein but should be at least about 10, preferably at least about 15 and most preferably at least about 20 nucleotides in length. Hybridization and PCR techniques suitable for use with such oligonucleotide probes are well known in the art. Positive clones may be analyzed by restriction enzyme digestion, DNA sequencing or the like.

30 In addition, the DNA sequences of the present invention may be generated by synthetic means using techniques well known in the art. Equipment for automated synthesis of oligonucleotides is commercially available from suppliers such as Perkin Elmer/Applied Biosystems Division (Foster City, CA) and may be operated according to the manufacturer's instructions.

In one embodiment, the DNA constructs of the present invention include an open reading frame coding for at least a functional portion of an enzyme encoded by a nucleotide sequence of the present invention or a variant thereof. As used herein, the "functional portion" of an enzyme is that portion which contains the active site essential for affecting the metabolic step, *i.e.* the portion of the molecule that is capable of binding one or more reactants or is capable of improving or regulating the rate of reaction. The active site may be made up of separate portions present on one or more polypeptide chains and will generally exhibit high substrate specificity. The term "enzyme encoded by a nucleotide sequence" as used herein, includes enzymes encoded by a nucleotide sequence which includes the partial isolated DNA sequences of the present invention.

For applications where amplification of lignin synthesis is desired, the open reading frame is inserted in the DNA construct in a sense orientation, such that transformation of a target plant with the DNA construct will lead to an increase in the number of copies of the gene and therefore an increase in the amount of enzyme. When down-regulation of lignin synthesis is desired, the open reading frame is inserted in the DNA construct in an antisense orientation, such that the RNA produced by transcription of the DNA sequence is complementary to the endogenous mRNA sequence. This, in turn, will result in a decrease in the number of copies of the gene and therefore a decrease in the amount of enzyme. Alternatively, regulation can be achieved by inserting appropriate sequences or subsequences (e.g. DNA or RNA) in ribozyme constructs.

In a second embodiment, the inventive DNA constructs comprise a nucleotide sequence including a non-coding region of a gene coding for an enzyme encoded by a DNA sequence of the present invention, or a nucleotide sequence complementary to such a non-coding region. As used herein the term "non-coding region" includes both transcribed sequences which are not translated, and non-transcribed sequences within about 2000 base pairs 5' or 3' of the translated sequences or open reading frames. Examples of non-coding regions which may be usefully employed in the inventive constructs include introns and 5'-non-coding leader sequences. Transformation of a target plant with such a DNA construct may lead to a reduction in the amount of lignin synthesized by the plant by the process of cosuppression, in a manner similar to that

discussed, for example, by Napoli et al. (Plant Cell 2:279-290, 1990) and de Carvalho Niebel et al. (Plant Cell 7:347-358, 1995).

The DNA constructs of the present invention further comprise a gene promoter sequence and a gene termination sequence, operably linked to the DNA sequence to be transcribed, which control expression of the gene. The gene promoter sequence is generally positioned at the 5' end of the DNA sequence to be transcribed, and is employed to initiate transcription of the DNA sequence. Gene promoter sequences are generally found in the 5' non-coding region of a gene but they may exist in introns (Luehrsen, K. R., Mol. Gen. Genet. 225:81-93, 1991) or in the coding region, as for example in PAL of tomato (Bloksberg, 1991, Studies on the Biology of Phenylalanine Ammonia Lyase and Plant Pathogen Interaction. Ph.D. Thesis, Univ. of California, Davis, University Microfilms International order number 9217564). When the construct includes an open reading frame in a sense orientation, the gene promoter sequence also initiates translation of the open reading frame. For DNA constructs comprising either an open reading frame in an antisense orientation or a non-coding region, the gene promoter sequence consists only of a transcription initiation site having a RNA polymerase binding site.

A variety of gene promoter sequences which may be usefully employed in the DNA constructs of the present invention are well known in the art. The promoter gene sequence, and also the gene termination sequence, may be endogenous to the target plant host or may be exogenous, provided the promoter is functional in the target host. For example, the promoter and termination sequences may be from other plant species, plant viruses, bacterial plasmids and the like. Preferably, gene promoter and termination sequences are from the inventive sequences themselves.

Factors influencing the choice of promoter include the desired tissue specificity of the construct, and the timing of transcription and translation. For example, constitutive promoters, such as the 35S Cauliflower Mosaic Virus (CaMV 35S) promoter, will affect the activity of the enzyme in all parts of the plant. Use of a tissue specific promoter will result in production of the desired sense or antisense RNA only in the tissue of interest. With DNA constructs employing inducible gene promoter sequences, the rate of RNA polymerase binding and initiation can be modulated by external stimuli, such as light, heat, anaerobic stress, alteration in nutrient conditions

and the like. Temporally regulated promoters can be employed to effect modulation of the rate of RNA polymerase binding and initiation at a specific time during development of a transformed cell. Preferably, the original promoters from the enzyme gene in question, or promoters from a specific tissue-targeted gene in the organism to be transformed, such as eucalyptus or pine are used. Other examples of gene promoters which may be usefully employed in the present invention include, mannopine synthase (mas), octopine synthase (ocs) and those reviewed by Chua et al. (Science, 244:174-181, 1989).

The gene termination sequence, which is located 3' to the DNA sequence to be transcribed, may come from the same gene as the gene promoter sequence or may be from a different gene. Many gene termination sequences known in the art may be usefully employed in the present invention, such as the 3' end of the *Agrobacterium tumefaciens* nopaline synthase gene. However, preferred gene terminator sequences are those from the original enzyme gene or from the target species to be transformed.

The DNA constructs of the present invention may also contain a selection marker that is effective in plant cells, to allow for the detection of transformed cells containing the inventive construct. Such markers, which are well known in the art, typically confer resistance to one or more toxins. One example of such a marker is the NPTII gene whose expression results in resistance to kanamycin or hygromycin, antibiotics which is usually toxic to plant cells at a moderate concentration (Rogers et al. in Methods for Plant Molecular Biology, A. Weissbach and H. Weissbach, eds., Academic Press Inc., San Diego, CA (1988)). Alternatively, the presence of the desired construct in transformed cells can be determined by means of other techniques well known in the art, such as Southern and Western blots.

Techniques for operatively linking the components of the inventive DNA constructs are well known in the art and include the use of synthetic linkers containing one or more restriction endonuclease sites as described, for example, by Maniatis et al., (*Molecular Cloning: A Laboratory Manual*, Cold Spring Harbor Laboratories, Cold Spring Harbor, NY, 1989). The DNA construct of the present invention may be linked to a vector having at least one replication system, for example, *E. coli*, whereby after each manipulation, the resulting construct can be cloned and sequenced and the correctness of the manipulation determined.

The DNA constructs of the present invention may be used to transform a variety of plants, both monocotyledonous (e.g. grasses, corn, grains, oat, wheat and barley), dicotyledonous (e.g. *Arabidopsis*, tobacco, legumes, alfalfa, oaks, eucalyptus, maple), and Gymnosperms (e.g. Scots pine (Aronen, Finnish Forest Res. Papers, vol. 595, 1996), white spruce (Ellis et al., Biotechnology 11:94-92, 1993), larch (Huang et al., In Vitro Cell 27:201-207, 1991). In a preferred embodiment, the inventive DNA constructs are employed to transform woody plants, herein defined as a tree or shrub whose stem lives for a number of years and increases in diameter each year by the addition of woody tissue. Preferably the target plant is selected from the group consisting of eucalyptus and pine species, most preferably from the group consisting of *Eucalyptus grandis* and *Pinus radiata*. As discussed above, transformation of a plant with a DNA construct including an open reading frame coding for an enzyme encoded by an inventive DNA sequence wherein the open reading frame is orientated in a sense direction will lead to an increase in lignin content of the plant or, in some cases, to a decrease by cosuppression. Transformation of a plant with a DNA construct comprising an open reading frame in an antisense orientation or a non-coding (untranslated) region of a gene will lead to a decrease in the lignin content of the transformed plant.

Techniques for stably incorporating DNA constructs into the genome of target plants are well known in the art and include *Agrobacterium tumefaciens* mediated introduction, electroporation, protoplast fusion, injection into reproductive organs, injection into immature embryos, high velocity projectile introduction and the like. The choice of technique will depend upon the target plant to be transformed. For example, dicotyledonous plants and certain monocots and gymnosperms may be transformed by *Agrobacterium* Ti plasmid technology, as described, for example by Bevan (Nucl. Acid Res. 12:8711-8721, 1984). Targets for the introduction of the DNA constructs of the present invention include tissues, such as leaf tissue, disseminated cells, protoplasts, seeds, embryos, meristematic regions; cotyledons, hypocotyls, and the like. One preferred method for transforming eucalyptus and pine is a biolistic method using pollen (see, for example, Aronen 1996, Finnish Forest Res. Papers vol. 595, 53pp) or easily regenerable embryonic tissues. Other transformation techniques which may be usefully employed in the inventive methods include those taught by Ellis et al. (Plant

Cell Reports, 8:16-20, 1989), Wilson et al. (Plant Cell Reports 7:704-707, 1989) and Tautorus et al. (Theor. Appl. Genet. 78:531-536, 1989).

Once the cells are transformed, cells having the inventive DNA construct incorporated in their genome may be selected by means of a marker, such as the kanamycin resistance marker discussed above. Transgenic cells may then be cultured in an appropriate medium to regenerate whole plants, using techniques well known in the art. In the case of protoplasts, the cell wall is allowed to reform under appropriate osmotic conditions. In the case of seeds or embryos, an appropriate germination or callus initiation medium is employed. For explants, an appropriate regeneration medium is used. Regeneration of plants is well established for many species. For a review of regeneration of forest trees see Dunstan et al., Somatic embryogenesis in woody plants. In: Thorpe, T.A. ed., 1995: in vitro embryogenesis of plants. Vol. 20 in Current Plant Science and Biotechnology in Agriculture, Chapter 12, pp. 471-540. Specific protocols for the regeneration of spruce are discussed by Roberts et al., (Somatic Embryogenesis of Spruce. In: *Synseed. Applications of synthetic seed to crop improvement*. Redenbaugh, K., ed. CRC Press, Chapter 23, pp. 427-449, 1993). The resulting transformed plants may be reproduced sexually or asexually, using methods well known in the art, to give successive generations of transgenic plants.

As discussed above, the production of RNA in target plant cells can be controlled by choice of the promoter sequence, or by selecting the number of functional copies or the site of integration of the DNA sequences incorporated into the genome of the target plant host. A target plant may be transformed with more than one DNA construct of the present invention, thereby modulating the lignin biosynthetic pathway for the activity of more than one enzyme, affecting enzyme activity in more than one tissue or affecting enzyme activity at more than one expression time. Similarly, a DNA construct may be assembled containing more than one open reading frame coding for an enzyme encoded by a DNA sequence of the present invention or more than one non-coding region of a gene coding for such an enzyme. The DNA sequences of the present inventive may also be employed in combination with other known sequences encoding enzymes involved in the lignin biosynthetic pathway. In this manner, it may be possible to add a lignin biosynthetic pathway to a non-woody plant to produce a new woody plant.

The isolated DNA sequences of the present invention may also be employed as probes to isolate DNA sequences encoding enzymes involved in the lignin synthetic pathway from other plant species, using techniques well known to those of skill in the art.

5 The following examples are offered by way of illustration and not by way of limitation.

Example 1

Isolation and Characterization of cDNA Clones from *Eucalyptus grandis*

10 Two *Eucalyptus grandis* cDNA expression libraries (one from a mixture of various tissues from a single tree and one from leaves of a single tree) were constructed and screened as follows.

mRNA was extracted from the plant tissue using the protocol of Chang et al. (Plant Molecular Biology Reporter 11:113-116 (1993)) with minor modifications.

15 Specifically, samples were dissolved in CPC-RNAXB (100 mM Tris-Cl, pH 8.0; 25 mM EDTA; 2.0 M NaCl; 2%CTAB; 2% PVP and 0.05% Spermidine*3 HCl) and extracted with Chloroform:isoamyl alcohol, 24:1. mRNA was precipitated with ethanol and the total RNA prepate was purified using a Poly(A) Quik mRNA Isolation Kit (Stratagene, La Jolla, CA). A cDNA expression library was constructed from the

20 purified mRNA by reverse transcriptase synthesis followed by insertion of the resulting cDNA clones in Lambda ZAP using a ZAP Express cDNA Synthesis Kit (Stratagene), according to the manufacturer's protocol. The resulting cDNAs were packaged using a Gigapack II Packaging Extract (Stratagene) employing 1 µl of sample DNA from the 5 µl ligation mix. Mass excision of the library was done using XL1-Blue MRF' cells and

25 XL0LR cells (Stratagene) with ExAssist helper phage (Stratagene). The excised phagemids were diluted with NZY broth (Gibco BRL, Gaithersburg, MD) and plated out onto LB-kanamycin agar plates containing X-gal and isopropylthio-beta-galactoside (IPTG).

Of the colonies plated and picked for DNA miniprep, 99% contained an insert

30 suitable for sequencing. Positive colonies were cultured in NZY broth with kanamycin and cDNA was purified by means of alkaline lysis and polyethylene glycol (PEG) precipitation. Agarose gel at 1% was used to screen sequencing templates for

chromosomal contamination. Dye primer sequences were prepared using a Turbo Catalyst 800 machine (Perkin Elmer/Applied Biosystems, Foster City, CA) according to the manufacturer's protocol.

DNA sequence for positive clones was obtained using an Applied Biosystems Prism 377 sequencer. cDNA clones were sequenced first from both the 5' end and, in some cases, also from the 3' end. For some clones, internal sequence was obtained using subcloned fragments. Subcloning was performed using standard procedures of restriction mapping and subcloning to pBluescript II SK+ vector.

The determined cDNA sequence was compared to known sequences in the EMBL database (release 46, March 1996) using the FASTA algorithm of February 1996 (version 2.0u4) (available on the Internet at the ftp site <ftp://ftp.virginia.edu/pub/fasta/>). Multiple alignments of redundant sequences were used to build up reliable consensus sequences. Based on similarity to known sequences from other plant species, the isolated DNA sequence (SEQ ID NO: 1) was identified as encoding a CAD enzyme.

In further studies, using the procedure described above, cDNA sequences encoding the following *Eucalyptus grandis* enzymes were isolated: PAL (SEQ ID NO: 16); C4H (SEQ ID NO: 17); C3H (SEQ ID NO: 18); F5H (SEQ ID NO: 19-21); OMT (SEQ ID NO: 22-25); CCR (SEQ ID NO: 26-29); CAD (SEQ ID NO: 30); CGT (SEQ ID NO: 31-33); CBG (SEQ ID NO: 34); PNL (SEQ ID NO: 35, 36); LAC (SEQ ID NO: 37-41); and POX (SEQ ID NO: 42-44).

Example 2

Isolation and Characterization of cDNA Clones from *Pinus radiata*

a) Isolation of cDNA clones by high through-put screening

A *Pinus radiata* cDNA expression library was constructed from xylem and screened as described above in Example 1. DNA sequence for positive clones was obtained using forward and reverse primers on an Applied Biosystems Prism 377 sequencer and the determined sequences were compared to known sequences in the database as described above.

Based on similarity to known sequences from other plant species, the isolated DNA sequences were identified as encoding the enzymes C4H (SEQ ID NO: 2 and 3), C3H (SEQ ID NO: 4), PNL (SEQ ID NO: 5), OMT (SEQ ID NO: 6), CAD (SEQ ID NO: 7), CCR (SEQ ID NO: 8), PAL (SEQ ID NO: 9-11) and 4CL (SEQ ID NO: 12).

5 In further studies, using the procedure described above, additional cDNA clones encoding the following *Pinus radiata* enzymes were isolated: PAL (SEQ ID NO: 45-47); C4H (SEQ ID NO: 48, 49); C3H (SEQ ID NO: 50-52); OMT (SEQ ID NO: 53-55); 4CL (SEQ ID NO: 56, 57); CCR (SEQ ID NO: 58-70); CAD (SEQ ID NO: 71); CGT (SEQ ID NO: 72); CBG (SEQ ID NO: 73-80); PNL (SEQ ID NO: 81); LAC
10 (SEQ ID NO: 82-84); and POX (SEQ ID NO: 85-88).

b) Isolation of cDNA clones by PCR

Two PCR probes, hereinafter referred to as LNB010 and LNB011 (SEQ ID NO: 14 and 15, respectively) were designed based on conserved domains in the following
15 peroxidase sequences previously identified in other species: vanpox, hvupox6, taepox, hvupox1, osapox, ntopox2, ntopox1, lespox, pokpox, luspox, athpox, hrpox, spopox, and tvepox (Genbank accession nos. D11337, M83671, X56011, X58396, X66125, J02979, D11396, X71593, D11102, L07554, M58381, X57564, Z22920, and Z31011, respectively).

20 RNA was isolated from pine xylem and first strand cDNA was synthesized as described above. This cDNA was subjected to PCR using 4 μ M LNB010, 4 μ M LNB011, 1 x Kogen's buffer, 0.1 mg/ml BSA, 200 mM dNTP, 2 mM Mg^{2+} , and 0.1 U/ μ l of Taq polymerase (Gibco BRL). Conditions were 2 cycles of 2 min at 94 °C, 1 min at 55 °C and 1 min at 72 °C; 25 cycles of 1 min at 94 °C, 1 min at 55 °C, and 1 min
25 at 72 °C; and 18 cycles of 1 min at 94 °C, 1 min at 55 °C, and 3 min at 72 °C in a Stratagene Robocycler. The gene was re-amplified in the same manner. A band of about 200 bp was purified from a TAE agarose gel using a Schleicher & Schuell Elu-Quik DNA purification kit and clones into a T-tailed pBluescript vector (Marchuk D. et al., Nucleic Acids Res. 19:1154, 1991). Based on similarity to known sequences, the
30 isolated gene (SEQ ID NO: 13) was identified as encoding pine peroxidase (POX).

Example 3

Use of an O-methyltransferase (OMT) Gene to Modify Lignin Biosynthesis

5 a) Transformation of tobacco plants with a *Pinus radiata* OMT gene

Sense and anti-sense constructs containing a sequence including the coding region of OMT (SEQ ID NO: 53) from *Pinus radiata* were inserted into *Agrobacterium tumefaciens* LBA4301 (provided as a gift by Dr. C. Kado, University of California, Davis, CA) by direct transformation using published methods (see, An G, Ebert PR, 10 Mitra A, Ha SB: Binary Vectors. In: Gelvin SB, Schilperoort RA (eds) Plant Molecular Biology Manual, Kluwer Academic Publishers, Dordrecht (1988)). The presence and integrity of the transgenic constructs were verified by restriction digestion and DNA sequencing.

Tobacco (*Nicotiana tabacum* cv. Samsun) leaf sections were transformed using 15 the method of Horsch et al. (Science, 227:1229-1231, 1985). Five independent transformed plant lines were established for the sense construct and eight independent transformed plant lines were established for the anti-sense construct for OMT. Transformed plants containing the appropriate lignin gene construct were verified using Southern blot experiments. A "+" in the column labeled "Southern" in Table 1 below 20 indicates that the transformed plant lines were confirmed as independent transformed lines.

b) Expression of *Pinus* OMT in transformed plants

Total RNA was isolated from each independent transformed plant line created 25 with the OMT sense and anti-sense constructs. The RNA samples were analysed in Northern blot experiments to determine the level of expression of the transgene in each transformed line. The data shown in the column labeled "Northern" in Table 1 shows that the transformed plant lines containing the sense and anti-sense constructs for OMT all exhibited high levels of expression, relative to the background on the Northern blots. 30 OMT expression in sense plant line number 2 was not measured because the RNA sample showed signs of degradation. There was no detectable hybridisation to RNA samples from empty vector-transformed control plants.

c) Modulation of OMT enzyme activity in transformed plants

The total activity of OMT enzyme, encoded by the *Pinus* OMT gene and by the endogenous tobacco OMT gene, in transformed tobacco plants was analysed for each transformed plant line created with the OMT sense and anti-sense constructs. Crude protein extracts were prepared from each transformed plant and assayed using the method of Zhang et al. (*Plant Physiol.*, 113:65-74, 1997). The data contained in the column labeled "Enzyme" in Table 1 shows that the transformed plant lines containing the OMT sense construct generally had elevated OMT enzyme activity, with a maximum of 199%, whereas the transformed plant lines containing the OMT anti-sense construct generally had reduced OMT enzyme activity, with a minimum of 35%, relative to empty vector-transformed control plants. OMT enzyme activity was not estimated in sense plant line number 3.

d) Effects of *Pinus* OMT on lignin concentration in transformed plants

The concentration of lignin in the transformed tobacco plants was determined using the well-established procedure of thioglycolic acid extraction (see, Freudenberg et al. in "Constitution and Biosynthesis of Lignin", Springer-Verlag, Berlin, 1968). Briefly, whole tobacco plants, of an average age of 38 days, were frozen in liquid nitrogen and ground to a fine powder in a mortar and pestle. 100 mg of frozen powder from one empty vector-transformed control plant line, the five independent transformed plant lines containing the sense construct for OMT and the eight independent transformed plant lines containing the anti-sense construct for OMT were extracted individually with methanol, followed by 10% thioglycolic acid and finally dissolved in 1 M NaOH. The final extracts were assayed for absorbance at 280 nm. The data shown in the column labelled "TGA" in Table 1 shows that the transformed plant lines containing the sense and the anti-sense OMT gene constructs all exhibited significantly decreased levels of lignin, relative to the empty vector-transformed control plant lines.

Table 1

	plant line	transgene	orientation	Southern	Northern	Enzyme	TGA
5	1	control	na	+	blank	100	104
	1	OMT	sense	+	2.9E+6	86	55
	2	OMT	sense	+	na	162	58
	3	OMT	sense	+	4.1E+6	na	63
10	4	OMT	sense	+	2.3E+6	142	66
	5	OMT	sense	+	3.6E+5	199	75
	1	OMT	anti-sense	+	1.6E+4	189	66
	2	OMT	anti-sense	+	5.7E+3	35	70
	3	OMT	anti-sense	+	8.0E+3	105	73
15	4	OMT	anti-sense	+	1.4E+4	109	74
	5	OMT	anti-sense	+	2.5E+4	87	78
	6	OMT	anti-sense	+	2.5E+4	58	84
	7	OMT	anti-sense	+	2.5E+4	97	92
20	8	OMT	anti-sense	+	1.1E+4	151	94

These data clearly indicate that lignin concentration, as measured by the TGA assay, can be directly manipulated by either sense or anti-sense expression of a lignin biosynthetic gene such as OMT.

Example 4Use of a 4-Coumarate:CoA ligase (4CL) Gene to Modify Lignin Biosynthesisa) Transformation of tobacco plants with a *Pinus radiata* 4CL gene

30 Sense and anti-sense constructs containing a sequence including the coding region of 4CL (SEQ ID NO: 56) from *Pinus radiata* were inserted into *Agrobacterium tumefaciens* LBA4301 by direct transformation as described above. The presence and integrity of the transgenic constructs were verified by restriction digestion and DNA sequencing.

35 Tobacco (*Nicotiana tabacum* cv. Samsun) leaf sections were transformed as described above. Five independent transformed plant lines were established for the sense construct and eight independent transformed plant lines were established for the anti-sense construct for 4CL. Transformed plants containing the appropriate lignin gene construct were verified using Southern blot experiments. A "+" in the column

labeled "Southern" in Table 2 indicates that the transformed plant lines listed were confirmed as independent transformed lines.

b) Expression of *Pinus* 4CL in transformed plants

5 Total RNA was isolated from each independent transformed plant line created with the 4CL sense and anti-sense constructs. The RNA samples were analysed in Northern blot experiments to determine the level of expression of the transgene in each transformed line. The data shown in the column labelled "Northern" in Table 2 below shows that the transformed plant lines containing the sense and anti-sense constructs for
10 4CL all exhibit high levels of expression, relative to the background on the Northern blots. 4CL expression in anti-sense plant line number 1 was not measured because the RNA was not available at the time of the experiment. There was no detectable hybridisation to RNA samples from empty vector-transformed control plants.

15 c) Modulation of 4CL enzyme activity in transformed plants

 The total activity of 4CL enzyme, encoded by the *Pinus* 4CL gene and by the endogenous tobacco 4CL gene, in transformed tobacco plants was analysed for each transformed plant line created with the 4CL sense and anti-sense constructs. Crude protein extracts were prepared from each transformed plant and assayed using the
20 method of Zhang et al. (*Plant Physiol.*, 113:65-74, 1997). The data contained in the column labeled "Enzyme" in Table 2 shows that the transformed plant lines containing the 4CL sense construct had elevated 4CL enzyme activity, with a maximum of 258%, and the transformed plant lines containing the 4CL anti-sense construct had reduced 4CL enzyme activity, with a minimum of 59%, relative to empty vector-transformed
25 control plants.

d) Effects of *Pinus* 4CL on lignin concentration in transformed plants

 The concentration of lignin in samples of transformed plant material was determined as described in Example 3. The data shown in the column labelled "TGA"
30 in Table 2 shows that the transformed plant lines containing the sense and the anti-sense 4CL gene constructs all exhibited significantly decreased levels of lignin, relative to the empty vector-transformed control plant lines. These data clearly indicate that

lignin concentration, as measured by the TGA assay, can be directly manipulated by either sense or anti-sense expression of a lignin biosynthetic gene such as 4CL.

5

Table 2

	plant line	transgene	orientation	Southern	Northern	Enzyme	TGA
	1	control	na	+	blank	100	92
10	2	control	na	+	blank	100	104
	1	4CL	sense	+	2.3E+4	169	64
	2	4CL	sense	+	4.5E+4	258	73
	3	4CL	sense	+	3.1E+4	174	77
	4	4CL	sense	+	1.7E+4	164	80
15	5	4CL	sense	+	1.6E+4	184	92
	1	4CL	anti-sense	+	na	59	75
	2	4CL	anti-sense	+	1.0E+4	70	75
	3	4CL	anti-sense	+	9.6E+3	81	80
	4	4CL	anti-sense	+	1.2E+4	90	83
20	5	4CL	anti-sense	+	4.7E+3	101	88
	6	4CL	anti-sense	+	3.9E+3	116	89
	7	4CL	anti-sense	+	1.8E+3	125	94
	8	4CL	anti-sense	+	1.7E+4	106	97

25

Example 5Transformation of Tobacco using the Inventive Lignin Biosynthetic Genes

30

Sense and anti-sense constructs containing sequences including the coding regions of C3H (SEQ ID NO: 18), F5H (SEQ ID NO: 19), CCR (SEQ ID NO: 25) and CGT (SEQ ID NO: 31) from *Eucalyptus grandis*, and PAL (SEQ ID NO: 45 and 47), C4H (SEQ ID NO: 48 and 49), PNL (SEQ ID NO: 81) and LAC (SEQ ID NO: 83) from *Pinus radiata* were inserted into *Agrobacterium tumefaciens* LBA4301 by direct transformation as described above. The presence and integrity of the transgenic constructs were verified by restriction digestion and DNA sequencing.

Tobacco (*Nicotiana tabacum* cv. Samsun) leaf sections were transformed as described in Example 3. Up to twelve independent transformed plant lines were established for each sense construct and each anti-sense construct listed in the preceding paragraph. Transformed plants containing the appropriate lignin gene

construct were verified using Southern blot experiments. All of the transformed plant lines analysed were confirmed as independent transformed lines.

Example 6

5

Manipulation of Lignin Content in Transformed Plants

a) Determination of transgene expression by Northern blot experiments

10 Total RNA was isolated from each independent transformed plant line described in Example 5. The RNA samples were analysed in Northern blot experiments to determine the level of expression of the transgene in each transformed line. The column labelled "Northern" in Table 3 shows the level of transgene expression for all plant lines assayed, relative to the background on the Northern blots. There was no detectable hybridisation to RNA samples from empty vector-transformed control
15 plants.

b) Determination of lignin concentration in transformed plants

The concentration of lignin in empty vector-transformed control plant lines and in up to twelve independent transformed lines for each sense construct and each anti-sense
20 construct described in Example 5 was determined as described in Example 3. The column labelled "TGA" in Table 3 shows the thioglycolic acid extractable lignins for all plant lines assayed, expressed as the average percentage of TGA extractable lignins in transformed plants versus control plants. The range of variation is shown in parentheses.

Table 3

	transgene	orientation	no. of lines	Northern	TGA
5	control	na	3	blank	100 (92-104)
	C3H	sense	5	3.7E+4	74 (67-85)
	F5H	sense	10	5.8E+4	70 (63-79)
	F5H	anti-sense	9	5.8E+4	73 (35-93)
10	CCR	sense	1	na	74
	CCR	anti-sense	2	na	74 (62-86)
	PAL	sense	5	1.9E+5	77 (71-86)
	PAL	anti-sense	4	1.5E+4	62 (37-77)
	C4H	anti-sense	10	5.8E+4	86 (52-113)
15	PNL	anti-sense	6	1.2E+4	88 (70-114)
	LAC	sense	5	1.7E+5	na
	LAC	anti-sense	12	1.7E+5	88 (73-114)

Transformed plant lines containing the sense and the anti-sense lignin biosynthetic gene constructs all exhibited significantly decreased levels of lignin, relative to the empty vector-transformed control plant lines. The most dramatic effects on lignin concentration were seen in the F5H anti-sense plants with as little as 35% of the amount of lignin in control plants, and in the PAL anti-sense plants with as little as 37% of the amount of lignin in control plants. These data clearly indicate that lignin concentration, as measured by the TGA assay, can be directly manipulated by conventional anti-sense methodology and also by sense over-expression using the inventive lignin biosynthetic genes.

Example 7Modulation of Lignin Enzyme Activity in Transformed Plants

The activities and substrate specificities of selected lignin biosynthetic enzymes were assayed in crude extracts from transformed tobacco plants containing sense and anti-sense constructs for PAL (SEQ ID NO: 45), PNL (SEQ ID NO: 81) and LAC (SEQ ID NO: 83) from *Pinus radiata*, and CGT (SEQ ID NO: 31) from *Eucalyptus grandis*.

Enzyme assays were performed using published methods for PAL (Southerton, S.G. and Deverall, B.J., Plant Path. 39:223-230, 1990), CGT (Vellekoop, P. et al., FEBS, 330:36-40, 1993), PNL (Espin, C.J. et al., Phytochemistry, 44:17-22, 1997) and

LAC (Bao, W. et al., Science, 260:672-674, 1993). The data shown in the column labelled "Enzyme" in Table 4 shows the average enzyme activity from replicate measures for all plant lines assayed, expressed as a percent of enzyme activity in empty vector-transformed control plants. The range of variation is shown in parentheses.

5

Table 4

	<u>transgene</u>	<u>orientation</u>	<u>no. of lines</u>	<u>Enzyme</u>
10	control	na	3	100
	PAL	sense	5	87 (60-124)
	PAL	anti-sense	3	53 (38-80)
	CGT	anti-sense	1	89
	PNL	anti-sense	6	144 (41-279)
15	LAC	sense	5	78 (16-240)
	LAC	anti-sense	11	64 (14-106)

All of the transformed plant lines, except the PNL anti-sense transformed plant lines, showed average lignin enzyme activities which were significantly lower than the activities observed in empty vector-transformed control plants. The most dramatic effects on lignin enzyme activities were seen in the PAL anti-sense transformed plant lines in which all of the lines showed reduced PAL activity and in the LAC anti-sense transformed plant lines which showed as little as 14% of the LAC activity in empty vector-transformed control plant lines.

25

Example 8

30

Functional Identification of Lignin Biosynthetic Genes

Sense constructs containing sequences including the coding regions for PAL (SEQ ID NO: 47), OMT (SEQ ID NO: 53), 4CL (SEQ ID NO: 56 and 57) and POX (SEQ ID NO: 86) from *Pinus radiata*, and OMT (SEQ ID NO: 23 and 24), CCR (SEQ ID NO: 26-28), CGT (SEQ ID NO: 31 and 33) and POX (SEQ ID NO: 42 and 44) from *Eucalyptus grandis* were inserted into the commercially available protein expression vector, pProEX-1 (Gibco BRL). The resultant constructs were transformed into *E. coli* XL1-Blue (Stratagene), which were then induced to produce recombinant protein by the addition of IPTG. Purified proteins were produced for the *Pinus* OMT and 4CL constructs and the *Eucalyptus* OMT and POX constructs using Ni column

40

chromatography (Janknecht, R. et al., Proc. Natl. Acad. Sci., 88:8972-8976, 1991). Enzyme assays for each of the purified proteins conclusively demonstrated the expected substrate specificity and enzymatic activity for the genes tested.

The data for two representative enzyme assay experiments, demonstrating the verification of the enzymatic activity of a *Pinus radiata* 4CL gene (SEQ ID NO: 56) and a *Pinus radiata* OMT gene (SEQ ID NO: 53), are shown in Table 5. For the 4CL enzyme, one unit equals the quantity of protein required to convert the substrate into product at the rate of 0.1 absorbance units per minute. For the OMT enzyme, one unit equals the quantity of protein required to convert 1 pmole of substrate to product per minute.

Table 5

	purification	total ml	total mg	total units	% yield	fold
transgene	step	extract	protein	activity	activity	purification
4CL	crude	10 ml	51 mg	4200	100	1
	Ni column	4 ml	0.84 mg	3680	88	53
OMT	crude	10 ml	74 mg	4600	100	1
	Ni column	4 ml	1.2 mg	4487	98	60

The data shown in Table 5 indicate that both the purified 4CL enzyme and the purified OMT enzyme show high activity in enzyme assays, confirming the identification of the 4CL and OMT genes described in this application. Crude protein preparations from *E. coli* transformed with empty vector show no activity in either the 4CL or the OMT enzyme assay.

Although the present invention has been described in some detail by way of illustration and example for purposes of clarity of understanding, changes and modifications can be carried out without departing from the scope of the invention which is intended to be limited only by the scope of the appended claims.

Claims:

1. An isolated DNA sequence comprising a nucleotide sequence selected from the group consisting of
 - (a) sequences recited in SEQ ID NO: 3, 13, 16-70, 72-88;
 - (b) complements of the sequences recited in SEQ ID NO: 3, 13, 16-70, 72-88;
 - (c) reverse complements of the sequences recited in SEQ ID NO: 3, 13, 16-70, 72-88;
 - (d) reverse sequences of the sequences recited in SEQ ID NO: 3, 13, 16-70, 72-88 and
 - (e) sequences having at least about a 99% probability of being the same as a sequence of (a) - (d) as measured by computer algorithm FASTA.
2. A DNA construct comprising a DNA sequence according to claim 1.
3. A transgenic cell comprising a DNA construct according to claim 2.
4. A DNA construct comprising, in the 5'-3' direction:
 - (a) a gene promoter sequence,
 - (b) an open reading frame coding for at least a functional portion of an enzyme encoded by a nucleotide sequence selected from the group consisting of sequences recited in SEQ ID NO: 3, 13, 16-70, 72-88 and sequences having at least about a 99% probability of being the same as a sequence of SEQ ID NO: 3, 13, 16-70, 72-88 as measured by computer algorithm FASTA; and
 - (c) a gene termination sequence.
5. The DNA construct of claim 4 wherein the open reading frame is in a sense orientation.

6. The DNA construct of claim 4 wherein the open reading frame is in an antisense orientation.
7. The DNA construct of claim 4, wherein the gene promoter sequence and gene termination sequences are functional in a plant host.
8. The DNA construct of claim 4, wherein the gene promoter sequence provides for transcription in xylem.
9. The DNA construct of claim 4 further comprising a marker for identification of transformed cells.
10. A DNA construct comprising, in the 5'-3' direction:
 - (a) a gene promoter sequence,
 - (b) a non-coding region of a gene coding for an enzyme encoded by a nucleotide sequence selected from the group consisting of sequences recited in SEQ ID NO: 3, 13, 16-70, 72-88 and sequences having at least about a 99% probability of being the same as a sequence of SEQ ID NO: 3, 13, 16-70, 72-88 as measured by computer algorithm FASTA; and
 - (c) a gene termination sequence.
11. The DNA construct of claim 10 wherein the non-coding region is in a sense orientation.
12. The DNA construct of claim 10 wherein the non-coding region is in an antisense orientation.
13. The DNA construct of claim 10, wherein the gene promoter sequence and gene termination sequences are functional in a plant host.
14. The DNA construct of claim 10, wherein the gene promoter sequence provides for transcription in xylem.

15. A transgenic plant cell comprising a DNA construct, the DNA construct comprising, in the 5'-3' direction:
 - (a) a gene promoter sequence;
 - (b) an open reading frame coding for at least a functional portion of an enzyme encoded by a nucleotide sequence selected from the group consisting of sequences recited in SEQ ID NO: 3, 13, 16-70, 72-88 and sequences having at least about a 99% probability of being the same as a sequence of SEQ ID NO: 3, 13, 16-70, 72-88 as measured by computer algorithm FASTA; and
 - (c) a gene termination sequence.
16. The transgenic plant cell of claim 15 wherein the open reading frame is in a sense orientation.
17. The transgenic plant cell of claim 15 wherein the open reading frame is in an antisense orientation.
18. The transgenic plant cell of claim 15 wherein the DNA construct further comprises a marker for identification of transformed cells.
19. A plant comprising a transgenic plant cell according to claim 15, or fruit or seeds thereof.
20. The plant of claim 19 wherein the plant is a woody plant.
21. The plant of claim 20 wherein the plant is selected from the group consisting of eucalyptus and pine species.
22. A transgenic plant cell comprising a DNA construct, the DNA construct comprising, in the 5'-3' direction:
 - (a) a gene promoter sequence;

- (b) a non-coding region of a gene coding for an enzyme encoded by a nucleotide sequence selected from the group consisting of sequences recited in SEQ ID NO: 3, 13, 16-70, 72-88 and sequences having at least about a 99% probability of being the same as a sequence of SEQ ID NO: 3, 13, 16-70, 72-88 as measured by computer algorithm FASTA; and
 - (c) a gene termination sequence.
- 23. The transgenic plant cell of claim 22 wherein the non-coding region is in a sense orientation.
- 24. The transgenic plant cell of claim 22 wherein the non-coding region is in an antisense orientation.
- 25. A plant comprising a transgenic plant cell according to claim 22, or fruit or seeds thereof.
- 26. The plant of claim 25 wherein the plant is a woody plant.
- 27. The plant of claim 26, wherein the plant is selected from the group consisting of eucalyptus and pine species.
- 28. A method for modulating the lignin content of a plant comprising stably incorporating into the genome of the plant a DNA construct comprising, in the 5'-3' direction:
 - (a) a gene promoter sequence;
 - (b) an open reading frame coding for at least a functional portion of an enzyme encoded by a nucleotide sequence selected from the group consisting of sequences recited in SEQ ID NO: 3, 13, 16-70, 72-88 and sequences having at least about a 99% probability of being the same as a sequence of SEQ ID NO: 3, 13, 16-70, 72-88 as measured by computer algorithm FASTA; and
 - (c) a gene termination sequence.

29. The method of claim 28 wherein the plant is selected from the group consisting of eucalyptus and pine species.
30. The method of claim 28 wherein the open reading frame is in a sense orientation.
31. The method of claim 28 wherein the open reading frame is in an antisense orientation.
32. A method for modulating the lignin content of a plant comprising stably incorporating into the genome of the plant a DNA construct comprising, in the 5'-3' direction:
 - (a) a gene promoter sequence;
 - (b) a non-coding region of a gene coding for an enzyme encoded by a nucleotide sequence selected from the group consisting of sequences recited in SEQ ID NO: 3, 13, 16-70, 72-88 and sequences having at least about a 99% probability of being the same as a sequence of SEQ ID NO: 3, 13, 16-70, 72-88 as measured by computer algorithm FASTA; and
 - (c) a gene termination sequence.
33. The method of claim 32 wherein the non-coding region is in a sense orientation.
34. The method of claim 32 wherein the non-coding region is in an antisense orientation.
35. The method of claim 32 wherein the plant is a woody plant.
36. The method of claim 35, wherein the plant is selected from the group consisting of eucalyptus and pine species.
37. A method for producing a plant having altered lignin structure comprising:

- (a) transforming a plant cell with a DNA construct comprising, in the 5'-3' direction, a gene promoter sequence, an open reading frame coding for at least a functional portion of an enzyme encoded by a nucleotide sequence selected from the group consisting of sequences recited in SEQ ID NO: 3, 13, 16-70, 72-88 and sequences having at least about a 99% probability of being the same as a sequence of SEQ ID NO: 3, 13, 16-70, 72-88 as measured by computer algorithm FASTA, and a gene termination sequence to provide a transgenic cell;
 - (b) cultivating the transgenic cell under conditions conducive to regeneration and mature plant growth.
- 38. The method of claim 37 wherein the open reading frame is in a sense orientation.
- 39. The method of claim 37 wherein the open reading frame is in an antisense orientation.
- 40. The method of claim 37 wherein the plant is a woody plant.
- 41. The method of claim 40 wherein the plant is selected from the group consisting of eucalyptus and pine species.
- 42. A method for producing a plant having altered lignin structure comprising:
 - (a) transforming a plant cell with a DNA construct comprising, in the 5'-3' direction, a gene promoter sequence, a non-coding region of a gene coding for an enzyme encoded by a nucleotide sequence selected from the group consisting of sequences recited in SEQ ID NO: 3, 13, 16-70, 72-88 and sequences having at least about a 99% probability of being the same as a sequence of SEQ ID NO: 3, 13, 16-70, 72-88 as measured by computer algorithm FASTA, and a gene termination sequence to provide a transgenic cell;

- (b) cultivating the transgenic cell under conditions conducive to regeneration and mature plant growth.
43. The method of claim 42 wherein the non-coding region is in a sense orientation.
44. The method of claim 42 wherein the non-coding region is in an antisense orientation.
45. The method of claim 42 wherein the plant is a woody plant.
46. The method of claim 45 wherein the plant is selected from the group consisting of eucalyptus and pine species.
47. A method of modifying the activity of an enzyme in a plant comprising stably incorporating into the genome of the plant a DNA construct including
- (a) a gene promoter sequence;
 - (b) an open reading frame coding for at least a functional portion of an enzyme encoded by a nucleotide sequence selected from the group consisting of sequences recited in SEQ ID NO: 3, 13, 16-70, 72-88 and sequences having at least about a 99% probability of being the same as a sequence of SEQ ID NO: 3, 13, 16-70, 72-88 as measured by computer algorithm FASTA; and
 - (c) a gene termination sequence.
48. The method of claim 47 wherein the open reading frame is in a sense orientation.
49. The method of claim 47 wherein the open reading frame is in an antisense orientation.
50. A method of modifying the activity of an enzyme in a plant comprising stably incorporating into the genome of the plant a DNA construct including

- (a) a gene promoter sequence;
 - (b) a non-coding region of a gene coding for an enzyme encoded by a nucleotide sequence selected from the group consisting of sequences recited in SEQ ID NO: 3, 13, 16-70, 72-88 and sequences having at least about a 99% probability of being the same as a sequence of SEQ ID NO: 3, 13, 16-70, 72-88 as measured by computer algorithm FASTA; and
 - (c) a gene termination sequence.
51. The method of claim 50 wherein the non-coding region is in a sense orientation.
52. The method of claim 50 wherein the non-coding region is in an antisense orientation.
53. The method of claim 50 wherein the plant is a woody plant.
54. The method of claim 53 wherein the plant is selected from the group consisting of eucalyptus and pine species.

FIG. 1

PCTWORLD INTELLECTUAL PROPERTY ORGANIZATION
International Bureau

INTERNATIONAL APPLICATION PUBLISHED UNDER THE PATENT COOPERATION TREATY (PCT)

(51) International Patent Classification ⁶ : C12N 15/53, 15/54, 15/52, 15/60, 15/82, A01H 5/00	A3	(11) International Publication Number: WO 98/11205 (43) International Publication Date: 19 March 1998 (19.03.98)
(21) International Application Number: PCT/NZ97/00112 (22) International Filing Date: 10 September 1997 (10.09.97) (30) Priority Data: 08/713,000 11 September 1996 (11.09.96) US (71) Applicants: GENESIS RESEARCH & DEVELOPMENT CORPORATION LIMITED [NZ/NZ]; 1 Fox Street, Parnell, Auckland (NZ). FLETCHER CHALLENGE FORESTS LIMITED [NZ/NZ]; 585 Great South Road, Penrose, Auckland (NZ). (72) Inventors: BLOKSBERG, Leonard, Nathan; 5A Korau Road, Greenlane, Auckland (NZ). GRIERSON, Alistair, Wallace; 1/24 Medina Place, Bucklands Beach, Auckland (NZ). HAVUKKALA, Ilkka, Jaakko; 3/121 Atkin Avenue, Mission Bay, Auckland (NZ). (74) Agents: BENNETT, Michael, Roy et al.; Russell McVeagh West-Walker, The Todd Building, Level 5, 171-177 Lambton Quay, Wellington 6001 (NZ).		(81) Designated States: AL, AM, AT, AU, AZ, BA, BB, BG, BR, BY, CA, CH, CN, CU, CZ, DE, DK, EE, ES, FI, GB, GE, GH, HU, ID, IL, IS, JP, KE, KG, KP, KR, KZ, LC, LK, LR, LS, LT, LU, LV, MD, MG, MK, MN, MW, MX, NO, NZ, PL, PT, RO, RU, SD, SE, SG, SI, SK, SL, TJ, TM, TR, TT, UA, UG, UZ, VN, YU, ZW, ARIPO patent (GH, KE, LS, MW, SD, SZ, UG, ZW), Eurasian patent (AM, AZ, BY, KG, KZ, MD, RU, TJ, TM), European patent (AT, BE, CH, DE, DK, ES, FI, FR, GB, GR, IE, IT, LU, MC, NL, PT, SE), OAPI patent (BF, BJ, CF, CG, CI, CM, GA, GN, ML, MR, NE, SN, TD, TG). Published <i>With international search report.</i> <i>Before the expiration of the time limit for amending the claims and to be republished in the event of the receipt of amendments.</i> (88) Date of publication of the international search report: 20 August 1998 (20.08.98)
(54) Title: MATERIALS AND METHODS FOR THE MODIFICATION OF PLANT LIGNIN CONTENT (57) Abstract Novel isolated DNA sequences associated with the lignin biosynthetic pathway are provided, together with DNA constructs including such sequences. Methods for the modulation of lignin content in plants are also disclosed, the methods comprising incorporating one or more of the inventive DNA sequences or a sequence complementary to an inventive DNA sequence into the genome of a plant.

INTERNATIONAL SEARCH REPORT

International Application No
PCT/NZ 97/00112

A. CLASSIFICATION OF SUBJECT MATTER

IPC 6 C12N15/53 C12N15/54 C12N15/52 C12N15/60 C12N15/82
A01H5/00

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

IPC 6 C12N A01H

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category *	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
X	BOUDET A M ET AL: "TANSLEY REVIEW NO. 80 BIOCHEMISTRY AND MOLECULAR BIOLOGY OF LIGNIFICATION" NEW PHYTOLOGIST, vol. 129, no. 2, 1 January 1995, pages 203-236, XP002006037 see page 216 - page 229 ---	1-54
X	BOUDET A M ET AL: "LIGNIN GENETIC ENGINEERING" MOLECULAR BREEDING, vol. 2, 1996, pages 25-39, XP002025844 see the whole document --- -/--	1-54

☒ Further documents are listed in the continuation of box C.

☒ Patent family members are listed in annex.

* Special categories of cited documents :

- *A* document defining the general state of the art which is not considered to be of particular relevance
- *E* earlier document but published on or after the international filing date
- *L* document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
- *O* document referring to an oral disclosure, use, exhibition or other means
- *P* document published prior to the international filing date but later than the priority date claimed

T later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

X document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

Y document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.

& document member of the same patent family

INTERNATIONAL SEARCH REPORT

International application No.
PCT/NZ 97/00112

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claims Nos.:
because they relate to subject matter not required to be searched by this Authority, namely:

2. ☐ Claims Nos.:
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:

3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

see additional sheet

1. ☒ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.

2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.

3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:

4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☒ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.

FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

This International Searching Authority found multiple (groups of) inventions in this international application, as follows:

1. Claims: 1-54 all partially

Isolated DNA sequences of ID nos 3,17,48,49 encoding cinnamate 4-hydroxylase (C4H), plant expression constructs incorporating said sequences, methods to modulate lignin content, structure, and enzyme activity in plants using said constructs, and transgenic plants and plant cells containing them.

2. Claims: 1-54 partially

Isolated DNA sequences of ID nos 18,50-52 encoding coumarate 3-hydroxylase (C3H), plant expression constructs incorporating said sequences, methods to modulate lignin content, structure, and enzyme activity in plants using said constructs, and transgenic plants and plant cells containing them.

3. Claims: 1-54 all partially

Isolated DNA sequences of ID nos 35,36,81 encoding phenolase (PNL), plant expression constructs incorporating said sequences, methods to modulate lignin content, structure, and enzyme activity in plants, transgenic plants and plant cells containing said constructs.

4. Claims: 1-54 all partially

Isolated DNA sequences of ID nos 22-25,53-55 encoding O-methyl transferase (OMT), plant expression constructs incorporating said sequences, methods to modulate lignin content, structure, and enzyme activity in plants using said constructs, and transgenic plants and plant cells containing them.

5. Claims: 1-54 all partially

Isolated DNA sequence of ID no 30, encoding cinnamyl alcohol dehydrogenase (CAD), plant expression constructs incorporating said sequences, methods to modulate lignin content, structure, and enzyme activity in plants using said constructs, and transgenic plants and plant cells containing them.

6. Claims: 1-54 all partially

Isolated DNA sequences of ID nos 26-29,58-70 encoding

FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

cinnamoyl-CoA reductase (CCR) ,plant expression constructs incorporating said sequences, methods to modulate lignin content, structure, and enzyme activity in plants using said constructs,and transgenic plants and plant cells containing them.

7. Claims: 1-54 all partially

Isolated DNA sequences of ID nos 16,45-47 encoding phenylalanine ammonia lyase (PAL),plant expression constructs incorporating said sequences, methods to modulate lignin content, structure, and enzyme activity in plants using said constructs,and transgenic plants and plant cells containing them.

8. Claims: 1-54 all partially

Isolated DNA sequences of ID nos 56,57 encoding 4-coumarate:CoA ligase (4CL),plant expression constructs incorporating said sequences, methods to modulate lignin content, structure, and enzyme activity in plants using said constructs,and transgenic plants and plant cells containing them.

9. Claims: 1-54 all partially

Isolated DNA sequences of ID nos 31-33,72 encoding coniferol glucosyl transferase (CGT),plant expression constructs incorporating said sequences, methods to modulate lignin content, structure, and enzyme activity in plants using said constructs,and transgenic plants and plant cells containing them.

10. Claims: 1-54 all partially

Isolated DNA sequences of ID nos 34,73-80 encoding coniferin beta-glucosidase (CBG) ,plant expression constructs incorporating said sequences, methods to modulate lignin content, structure, and enzyme activity in plants using said constructs,and transgenic plants and plant cells containing them.

11. Claims: 1-54 all partially

Isolated DNA sequences of ID nos 37-41,82-84 encoding laccase (LAC) ,plant expression constructs incorporating said sequences, methods to modulate lignin content, structure, and enzyme activity in plants using said constructs,and transgenic plants and plant cells containing them.

FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

12. Claims: 1-54 all partially

Isolated DNA sequences of ID nos 13,42-44,85-88 encoding peroxidase (POX), plant expression constructs incorporating said sequences, methods to modulate lignin content, structure, and enzyme activity in plants using said constructs, and transgenic plants and plant cells containing them.

13. Claims: 1-54 all partially

Isolated DNA sequences of ID nos 19-21 encoding ferulate-5-hydroxylase (F5H), plant expression constructs incorporating said sequences, methods to modulate lignin content, structure, and enzyme activity in plants using said constructs, and transgenic plants and plant cells containing them.
